

# Driver Electronic Device Use in 2018

## Summary

The percentage of passenger vehicle drivers talking on handheld phones increased from 2.9 percent in 2017 to 3.2 percent in 2018 (Figure 1 and Table 1). The percentage of drivers speaking with visible headsets while driving decreased from 0.45 percent in 2017 to 0.35 percent in 2018 (Figure 1 and Table 2). Drivers' visible manipulation of handheld devices increased from 2.0 percent in 2017 to 2.1 percent in 2018 (Figure 1 and Table 3). Each of these year-to-year changes are not statistically significant. These results are from the

National Occupant Protection Use Survey (NOPUS), which provides the only nationwide probability-based observed data on driver electronic device use in the United States. The NOPUS is conducted annually by the National Center for Statistics and Analysis of the National Highway Traffic Safety Administration. The percentages provided in this research note are interpreted as the percentage of drivers nationwide at a typical daylight moment.

Figure 1  
Driver Use of Electronic Devices, 2009–2018

## Results

NOPUS observes three types of driver electronic device use while driving: “holding phones to their ears,” “speaking with visible headsets on,” and “visibly manipulating handheld devices.” The results of these observations follow.

### Drivers Holding Phones to Their Ears While Driving

The percentage of drivers holding cellphones to their ears while driving increased from 2.9 percent in 2017 to 3.2 percent in 2018 (Figure 1 and Table 1). This translates to an estimated 472,486 passenger vehicle drivers holding cell phones to their ears while driving at a typical daylight moment in

2018. An estimated 9.7 percent of drivers were using some type of phone, either handheld or hands-free, at a typical daylight moment in 2018 (refer to the section **Estimating Overall Cellphone Use, Both Handheld and Hands-Free** for more details on this estimate).

The 2018 NOPUS found that handheld cellphone use continued to be higher among female drivers than male drivers (Figure 2 and Table 1). It also found that handheld cellphone use continued to be highest among 16- to 24-year-old drivers and lowest among drivers 70 and older (Figure 3 and Table 1). Handheld cellphone use among drivers 70 and older increased significantly from 0.8 percent in 2017 to 1.9 percent in 2018.

Figure 2  
**Driver Handheld Cellphone Use by Gender, 2009–2018**

Figure 3  
**Driver Handheld Cellphone Use by Age, 2009–2018**

## Drivers Speaking With Visible Headsets On While Driving

Table 2 shows the percentages of drivers speaking with visible headsets on while driving in 2017 and 2018, by major characteristics.

The percentage of drivers speaking with visible headsets while driving decreased from 0.45 percent in 2017 to 0.35 percent in 2018, as shown in Figure 1 and Table 2. Figure 4 displays the trends of drivers speaking with visible headsets for the three age groups over a 10-year period. There was no significant change in headset use from 2017 to 2018 for any age group.

There was a significant year-to-year decrease in the percentage of drivers speaking with visible headsets on while driving among drivers in the northeast region and drivers traveling during the weekday rush hours (Table 2).

Figure 4  
**Drivers Speaking With Visible Headsets On by Age, 2009–2018**

Note: Missing data points signify insufficient data to produce reliable estimates.

### Drivers Visibly Manipulating Handheld Devices While Driving

The percentage of drivers visibly manipulating handheld devices while driving increased from 2.0 percent in 2017 to 2.1 percent in 2018 (Figure 1 and Table 3). Table 3 presents the percentages of drivers visibly manipulating handheld devices in 2017 and 2018 by major characteristics.

The 2018 NOPUS observed a significant decrease in visible manipulation of handheld electronic devices among drivers

in the northeast region, from 2.8 percent in 2017 to 2.0 percent in 2018 (Table 3).

Figure 5 shows that driver manipulation of handheld device continued to be higher among 16- to 24-year-olds than other age groups.

Figure 5  
**Drivers Visibly Manipulating Handheld Devices by Age, 2009–2018**

Note: Missing data points signify insufficient data to produce reliable estimates.

Some Passengers Under 8, and Some 8 or Older	1.9%	(0.9, 3.9)	1.2%	(0.6, 2.6)	-0.7	(-2.3, 1.0)	0.42

<sup>1</sup> Drivers of passenger vehicles stopped at a stop sign or stoplight between the hours of 7 a.m. and 6 p.m.

<sup>2</sup> The percentage of drivers holding a phone to their ears, based on the subjective assessments of roadside observers.

<sup>3</sup> The Wilson confidence interval is used in the estimated percentages in the driver group (e.g., drivers in urban areas), which is in the form:  $\{(2n_{EFF}p + t^2) \pm t\sqrt{(t^2 + 4n_{EFF}pq)}\} / (2(n_{EFF} + t^2))$ , where  $p$  is the estimated percentage of drivers holding phones to ears,  $n_{EFF} = n/D_{EFF}$  is the effective sample size (where  $n$  is the sample size and  $D_{EFF}$  is the design effect),  $t = t_{(1-\alpha/2)}(df)$ , is a multiplier from the t-distribution with  $df$  degrees of freedom, and  $q = 1 - p$ . For percentages, these endpoints are multiplied by 100.

<sup>4</sup> The regular symmetric interval was used for the estimated change in percentage point, which is in the form:  $p \pm t_{(1-\alpha/2)}(df)\sqrt{v(p)}$ , where  $p$  is the estimated change in percentage point,  $v(p)$  is its estimated variance, and  $t_{(1-\alpha/2)}(df)$  is a multiplier from the t-distribution with  $df$  degrees of freedom. The degrees of freedom used in 2018 is different from that used in 2017.

<sup>5</sup> A p-value of 0.05 or less indicates that there is a statistically significant difference (at the alpha=0.05 level) between the 2017 and 2018 estimates for the group in question, indicated with bold type.

<sup>6</sup> Age, gender, and racial classifications are based on the subjective assessments of roadside observers.

<sup>7</sup> The "Change in Percentage Points" column was computed using unrounded estimates and may not equal the difference between the rounded estimates displayed in the table.

At Least One Passenger	0.8%	(0.6, 1.2)	0.9%	(0.6, 1.4)	0.1	(-0.2, 0.4)	0.52
Drivers With <sup>5</sup>							
No Passengers	2.5%	(2.0, 3.3)	2.6%	(2.0, 3.4)	0.1	(-0.7, 0.8)	0.85
Passengers All Under Age 8	1.8%	(1.1, 2.7)	2.2%	(1.2, 3.8)	0.4	(-0.8, 1.6)	0.51
Passengers All 8 and Older	0.7%	(0.5, 1.0)	0.9%	(0.6, 1.3)	0.2	(-0.1, 0.5)	0.28
<b>Some Passengers Under 8, and Some 8 or Older</b>	<b>1.3%</b>	<b>(0.5, 2.9)</b>	<b>0.3%</b>	<b>(0.1, 1.0)</b>	<b>-0.9</b>	<b>(-1.8, -0.0)</b>	<b>0.04</b>

<sup>1</sup> Drivers of passenger vehicles stopped at a stop sign or stoplight between the hours of 7 a.m. and 6 p.m.

<sup>2</sup> The percentage of drivers visibly manipulating handheld devices while driving, based on the subjective assessments of roadside observers.

<sup>3</sup> The Wilson confidence interval is used in the estimated percentages in the driver group (e.g., drivers in urban areas), which is in the form:  $\{(2n_{EFF}p + t^2) \pm t\sqrt{(t^2 + 4n_{EFF}pq)}\} / (2(n_{EFF} + t^2))$ , where  $p$  is the estimated percentage of drivers visibly manipulating handheld devices,  $n_{EFF} = n/D_{EFF}$  is the effective sample size (where  $n$  is the sample size and  $D_{EFF}$  is the design effect),  $t = t_{(1-\alpha/2)}(df)$ , is a multiplier from the t-distribution with  $df$  degrees of freedom, and  $q = 1 - p$ . For percentages, these endpoints are multiplied by 100.

<sup>4</sup> The regular symmetric interval was used for the estimated change in percentage point, which is in the form:  $p \pm t_{(1-\alpha/2)}(df)\sqrt{v(p)}$ , where  $p$  is the estimated change in percentage point,  $v(p)$  is its estimated variance, and  $t_{(1-\alpha/2)}(df)$  is a multiplier from the t-distribution with  $df$  degrees of freedom. The degrees of freedom used in 2018 is different from that used in 2017.

<sup>5</sup> A p-value of 0.05 or less indicates that there is a statistically significant difference (at the alpha=0.05 level) between the 2017 and 2018 estimates for the group in question, indicated with bold type.

<sup>6</sup> Age, gender, and racial classifications are based on the subjective assessments of roadside observers.

<sup>7</sup> The "Change in Percentage Points" column was computed using unrounded estimates and may not equal the difference between the rounded estimates displayed in the table.

**Data Source:** NOPUS, NCSA, 2017, 2018

## NOPUS Data Collection and Estimation

NOPUS is the only nationwide probability-based observational survey of driver electronic device use in the United States. The survey observes usage as it actually occurs at randomly selected roadway sites and thus provides the best tracking of the extent to which people in the United States use cellphones and other electronic devices while driving.

The survey data is collected by trained data collectors at probabilistically sampled intersections controlled by stop signs or stoplights, where data collectors observe, from the roadside, drivers and other occupants of passenger vehicles. Data is collected from 7 a.m. to 6 p.m. Only stopped vehicles are observed to allow time to collect the variety of information required by the survey, including subjective assessments of occupants' age and race. Observers collect data on the driver, right-front passenger, and up to two passengers in the second row of seats. Observers do not interview occupants, so that NOPUS can capture the untainted behavior of occupants. The 2018 NOPUS data was collected from June 4 to June 20, 2018 while the 2017 data was collected from June 5 to June 19, 2017.

Statistically significant increases and decreases in the use of handheld phones, headset use, and manipulation of handheld devices from 2017 to 2018 are shown, respectively, in Table 1, Table 2, and Table 3 by having a p-value of 0.05 or less in the tables' far-right column.

The NOPUS uses a complex multistage probability sample, statistical data editing, imputation of unknown values, and complex estimation procedures. The sample sites for the 2018 NOPUS were entirely from the 2015 NOPUS sample redesign. Table 4 shows the observed sample sizes of the 2018 NOPUS: 51,414 vehicles were observed at the 1,612 data collection sites. Due to ineligibility, construction, danger in the area, or road closure, the observations could not be completed at some of the sampled observation sites.

Table 4  
Sites and Vehicles Observed in the 2018 NOPUS

Number of	2017	2018	Percentage Change
Sites Observed	1,615	1,612	-0.2%
Vehicles Observed	50,577	51,414	1.7%

Data collection, estimation, and variance estimation for NOPUS are conducted by Westat, Inc., under the direction of NCSA under Federal contract number 693JJ918D000001.

## NOPUS Categories and Definitions

NOPUS observes three types of driver electronic device use while driving: "holding phones to their ears," "speaking with visible headsets on," and "visibly manipulating handheld devices."

Drivers are counted as "holding phones to their ears" if they are holding to their ears what appear to the data collectors to be phones. This would include behaviors such as drivers

engaging in conversation, listening to messages, or conducting voice-activated dialing while holding phones to their ears. However, a data collector may not have knowledge of various types of wireless phones. Thus, the device that has been identified as a "phone" may only reflect his/her conception of what constitutes a "phone."

Drivers are counted as "speaking with visible headsets on" if they appear to be speaking and wearing a headset with a microphone. This would include behaviors such as talking, engaging in conversation, or conducting voice-activated dialing via a wireless earpiece on the driver's right ear or via an ear bud connected by wire to a cellphone. Talking via a visible Bluetooth headset (usually on the driver's right ear) would also be included in this category. However, it would not include drivers using headsets that do not involve cellphones (e.g., iPods), since these headsets do not involve microphones. Note that the wireless earpieces that are obscured by hair or clothing or are on the driver's left ear would not be included because they would not be visible to the roadside observer. In addition, some wireless ear buds would not be included as they are too small to be observed from the roadside. The drivers with headsets who are not speaking at the time of observation are not included because they might have recently completed a call or be waiting for an expected call. Each driver in the survey is observed for about 10 seconds before the data collector decides whether or not the driver is speaking. Also, note that the drivers counted as speaking through a visible headset might have been talking to a passenger or using voice-activated computer software rather than using a phone.

Drivers are counted as "visibly manipulating handheld devices" if they appear to be manipulating some type of electronic device such as a cellphone, a smart phone, tablet, video game, or some other device. This would include behaviors such as text messaging, using a web-capable smart phone (e.g., an iPhone) or a tablet (e.g., iPad) to view travel directions, check e-mails or calendar appointments, or surf the internet, manual dialing, playing handheld games, and holding phones in front of their faces to converse or check messages via speakerphone or use voice-activated dialing. Manipulation of the non-handheld devices (adjusting volume on stereos, pressing buttons on a dashboard GPS unit, etc.) is not included in this category. Also, note that a driver characterized by the survey as "manipulating handheld device" may or may not have been speaking.

There are means by which the drivers can use cellphones that would neither be recorded as "holding phones to their ears" nor as "speaking with visible headsets on" nor as "visibly manipulating handheld devices" in the NOPUS. These would include: (1) a driver using a cellphone headset but is not speaking during the approximately 10-second period when he/she is being observed, and (2) a driver using technologies that cannot be observed from the roadside. The unobservable technologies would include: a wireless earpiece obscured by hair or clothing or on the left ear, a driver conversing via a

speakerphone with the phone on the passenger seat or in a cellphone holder on the vehicle dashboard, a driver using a phone that is built into the vehicle (e.g., OnStar), and a driver using the cellphone hands-free via a Bluetooth car kit or via a Bluetooth system that is built into the vehicle (e.g., Sync). It is possible that at some point in the future, NOPUS may be able to capture such behaviors by directing a device that can detect cellphones in-use in the passing vehicles.

The racial categories “Black,” “White,” and “Members of Other Races” appearing in the tables reflect subjective characterizations by roadside observers regarding the race of occupants. Likewise, observers record the age group (8-15; 16-24; 25-69; and 70 or older) that best fits their visual assessment of each observed occupant.

“Expressway Exit Ramps” are defined as the access roads from roadways with limited access, while “Other Surface Streets” comprise all other roadways.

“Weekday Rush Hours” are defined to be 7 a.m. to 9:30 a.m. and 3:30 p.m. to 6 p.m. on weekdays, while “Weekday Non-Rush Hours” comprise all other weekday hours (9:30 a.m. to 3:30 p.m.).

As of 2018, sites where light precipitation or light fog are present are collapsed into a single category, “Not Clear Weather Conditions.”

Since NOPUS is not a census and is based on a probability sample, it is impossible to produce State-by-State driver electronic device use results. However, NOPUS produces regional estimates of the use rates based on the following categories:

- **Northeast:** ME, VT, NH, MA, RI, CT, NY, PA, NJ
- **Midwest:** MI, OH, IN, IL, WI, MN, IA, MO, KS, NE, SD, ND
- **South:** WV, MD, DE, VA, KY, TN, NC, SC, GA, FL, AL, MS, AR, LA, OK, TX, DC
- **West:** AK, WA, OR, CA, NV, ID, UT, AZ, NM, CO, WY, MT, HI

Please note that since 2015, we use an objective area type classification to replace the subjective area type based on trained data collectors’ best judgement. Each NOPUS site is assigned an objective area type characterization based on the Census Bureau definitions of urbanized areas and urban clusters (see <https://www.census.gov/programs-surveys/geography/guidance/geo-areas/urban-rural.html>). It is defined as:

- **Urban:** A site which intersects an urbanized area or urban cluster (i.e., an area of at least 2,500 people);
- **Rural:** All other sites.

## Estimating Overall Cellphone Use, Both Handheld and Hands-Free

NHTSA’s 2016 Motor Vehicle Occupant Safety Survey (MVOSS) estimated that for drivers using cellphones while driving, 33 percent tended to use handheld cellphones and 67 percent tended to use hands-free phones. Applying the proportion  $2.0303 (= 67/33)$  of these percentages to the 3.2 percent estimate of drivers using handheld cellphones in 2018 from NOPUS shows an estimated 6.5 ( $= 2.0303 \times 3.2$ ) percent of drivers using hands-free cellphones. Thus, a total of 9.7 ( $= 3.2 + 6.5$ ) percent of drivers are estimated to be using either a handheld or a hands-free cellphone while driving at a typical daylight moment in the United States in 2018. Please note that the MVOSS estimates are based on self-reported use from both day and nighttime driving while the NOPUS estimates are observed during daylight hours.

## State Laws on Driver Electronic Device Use (Enacted as of March 31, 2018)

Many States restrict cellphone use by drivers. As of May 31, 2018, no State completely bans all forms of cellphone use by drivers. However, Table 5 shows that a ban on driving while talking on a handheld cellphone was in place in 15 States, the District of Columbia, Puerto Rico, Guam, and the U.S. Virgin Islands (Governors Highway Safety Association, 2019; Highway Loss Data Institute, 2019). All these laws are primary enforcement—an officer may cite a driver for using a handheld cellphone without any other traffic offense taking place.

Forty-seven States, the District of Columbia, Puerto Rico, Guam, and the U.S. Virgin Islands ban text messaging for all drivers (Table 6). In 43 States, the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands texting laws are primary enforcement, and 4 States have secondary enforcement of texting for drivers. Of the 3 States without an all driver texting ban, 2 prohibit text messaging by novice drivers and 1 restricts school bus drivers from texting.

Table 5  
States and U.S. Territories With Laws<sup>†</sup> Banning Handheld Cellphone Use While Driving

California	Connecticut	Delaware	Hawaii	Illinois
Maryland	Nevada	New Hampshire	New Jersey	New York
Oregon	Rhode Island	Vermont	Washington	West Virginia
District of Columbia	Puerto Rico	Guam	U.S. Virgin Islands	

<sup>†</sup>States and the District of Columbia with laws in effect as of May 31, 2018

Table 6  
**States and U.S. Territories With Laws<sup>†</sup> Banning Text-Messaging While Driving**

Alabama	Alaska	Arkansas	California	Colorado
Connecticut	Delaware	Florida*	Georgia	Hawaii
Idaho	Illinois	Indiana	Iowa	Kansas
Kentucky	Louisiana	Maine	Maryland	Massachusetts
Michigan	Minnesota	Mississippi	Nebraska*	Nevada
New Hampshire	New Jersey	New Mexico	New York	North Carolina
North Dakota	Ohio*	Oklahoma	Oregon	Pennsylvania
Rhode Island	South Carolina	South Dakota*	Tennessee	Texas
Utah	Vermont	Virginia	Washington	West Virginia
Wisconsin	Wyoming	District of Columbia	Puerto Rico	Guam
U.S. Virgin Islands				

<sup>†</sup>States and the District of Columbia with laws in effect as of May 31, 2018  
 Note: States with\* have secondary enforcement of texting for drivers.

Arkansas also bans the use of handheld cellphones while driving in a school zone or in a highway construction zone. This law is secondarily enforced. Texas has banned the use of cellphones and texting in school zones.
